Cloud
Cloud Connectivity

Cloud connectivity is provided through a cloud exchange powered by Megaport. Cloud Exchange is an advanced interconnection solution that enables on-demand, direct network connectivity to multiple cloud providers in major metro areas.

CLOUD CONNECTIVITY

Cloud Exchange Features
• Secure, high-performance connections- The Cloud Exchange (powered) by Megaport, provides virtualized, private direct connections that bypass the internet to provide better security and performance with bandwidth ranging from 50 Mbps to 10 Gbps
• On-demand, automated connectivity to the clouds – API's simplify the process of provisioning and managing connections to multiple cloud services and networks
• One port, many connections – Connect to many participants (clouds, networks, managed service providers) over a single port

Cloud Exchange Benefits
• Improved performance of cloud-based applications and workloads through high-throughput, low-latency connections
• Automated, near-real-time provisioning of cloud services from multiple providers, with enhanced service orchestration and management capabilities
• Multiple, flexible bandwidth options that can support fluctuating traffic needs without having to maintain constant peak-level capacity
• Increased security by keeping applications within your data center's local area network
